

JUST YOUR SPEED

The VYNL Bikes approach to fast bikes is a combination of tried-and-true aluminum construction and clever race-bred geometry. The result is a durable and lively ride that's best described as fun.

Aluminum, the Durable Upsetter

We are here to rally aluminum as the best material for hard riding racers and cyclists. Aluminum is light, stiff and durable. It can handle poor weather commutes, dawn patrol endurance rides and post-work intervals without a flinch. Come the weekend, the same bike can line up with the best of them on course or lead out an all-day adventure. This is why every VYNL is constructed of hand selected 7005 age-hardened aluminum.

Race-bred Geometry

VYNL geometries are different from our aluminum competition. The reach is a little longer and the stack is a little shorter, allowing the riding position to feel more aggressive. The combination of a classic racing 73° head tube angle and a reduced fork offset deliver a sweet spot between responsiveness and stability. Our chainstays are shorter and bottom brackets lower, creating a bike that drives corners.

Our race-bred approach to geometry creates a competitive ride characteristic that's precise, responsive and snappy. Your VYNL ride can be tuned with your preference of wheels, tires, stem and seat post. However you build your frame, every VYNL has a penchant to transfer power, rail corners and rip descents.
